The International Spring University (ISU), an initiative of the Basque Centre for Climate Change (BC3), announces a 1-week training on Ecosystem Services Modeling.

The 2019 event is directed to a new generation of scientists and policy analysts who can effectively use coupled human-environmental models in research, policy and management to address and solve sustainable problems. This year's event is also intended as an update on the latest developments in the k.LAB modeling software, including key updates to make model coding and reuse more user friendly, targeted for both new participants and those from previous years.

The 2019 edition is held in collaboration with the [ALICE Project](#) co-funded by the EU [INTERREG Atlantic Area](#) Programme.

The main goal of ALICE is to promote sustainable investments in [Blue-Green Infrastructure Networks](#) (BGINs) through identification of the benefits of [Ecosystem Services](#) delivered at the terrestrial-aquatic and land-sea interface in the Atlantic Region.
